Abstract

The project "**Magpie**" addresses this need by demonstrating encryption through a Python-based application. This project is important as it provides both a command-line interface (**CLI**) and a graphical user interface (**GUI**), making cryptographic principles accessible and interactive for users.

The primary objective of the Magpie project is to implement and demonstrate the fundamental principles of cryptography and information security. It later aims to offer **Image encryption and decryption** using a super key by implementing **SHA-512**. Magpie employs Python as the core programming language, integrating the cryptography library for implementing symmetric encryption using the hashing through **SHA-256**. The methodology involves key generation, encryption, decryption, and error handling to ensure secure and efficient processing of text messages.

The project is anticipated to effectively demonstrate the concepts of symmetric encryption and hashing, providing security and users with a practical understanding of cryptographic principles.

Magpie has the potential to significantly impact the educational domain by serving as a valuable learning tool for cryptography and information security. It simplifies complex cryptographic concepts, making them accessible to a broader audience.

Objectives

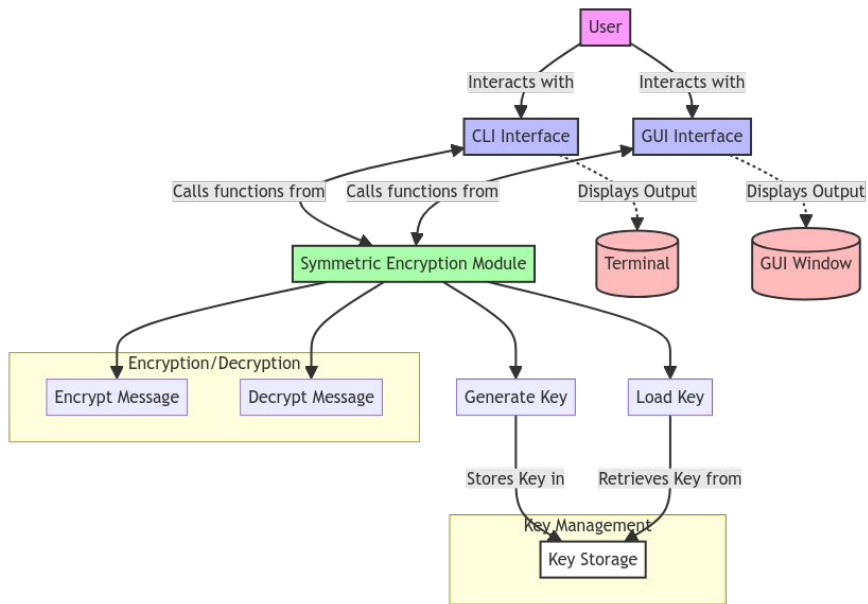

1. **Key Management:**

- a. **generate_key ()**: Generates a new symmetric encryption key and saves it to a file named 'key.key'.
- b. **load_key ()**: Loads the encryption key from the 'key.key' file. If the file does not exist, it generates a new key.

2. **Encryption**: Encrypts a message using symmetric encryption with the provided key.

3. **Decryption**: Decrypts an encrypted message using the provided key. It handles potential errors such as invalid tokens or bin ascii errors.

4. **Error Handling**: The module handles errors such as missing key files and invalid tokens during decryption. It raises custom exceptions (`KeyNotFoundError`) to notify users of key-related issues.

System Architecture

Proposed System

1. **User-friendly GUI:** The encryption system offers an intuitive graphical user interface (GUI) that simplifies the encryption and decryption process, making it accessible even for users without technical expertise.
2. **Hash Libraries (SHA-256) and Fernet Cryptography:** The system utilizes SHA-256 for hashing, ensuring data integrity, and Fernet cryptography for encryption, providing strong and reliable security measures to protect sensitive information.
3. **Error Logging for Debugging and Auditing:** The system incorporates robust error logging mechanisms, enabling developers to troubleshoot issues efficiently and maintain a detailed audit trail for security and compliance purposes.

Output

```
Enter option: e
Enter your message: hello everyone
Want to generate a new key? (y/n): n
Ciphered Text:
gAAAAABmVaIosmWtqRSE5PT47vHShSkK0MkLS7I
MxK1fZxyUBAapJKf4tbGN6xuwYPbDA==
```

'hello everyone' given as input

```
Enter option: d
Enter Ciphered Text: gAAAAABmVaIosmWtqI
vqVRlpUWnUNwRg5o_Ev3jMxK1fZxyUBAapJKf4
Want to enter key? (y/n): n
Message is:
hello everyone
```

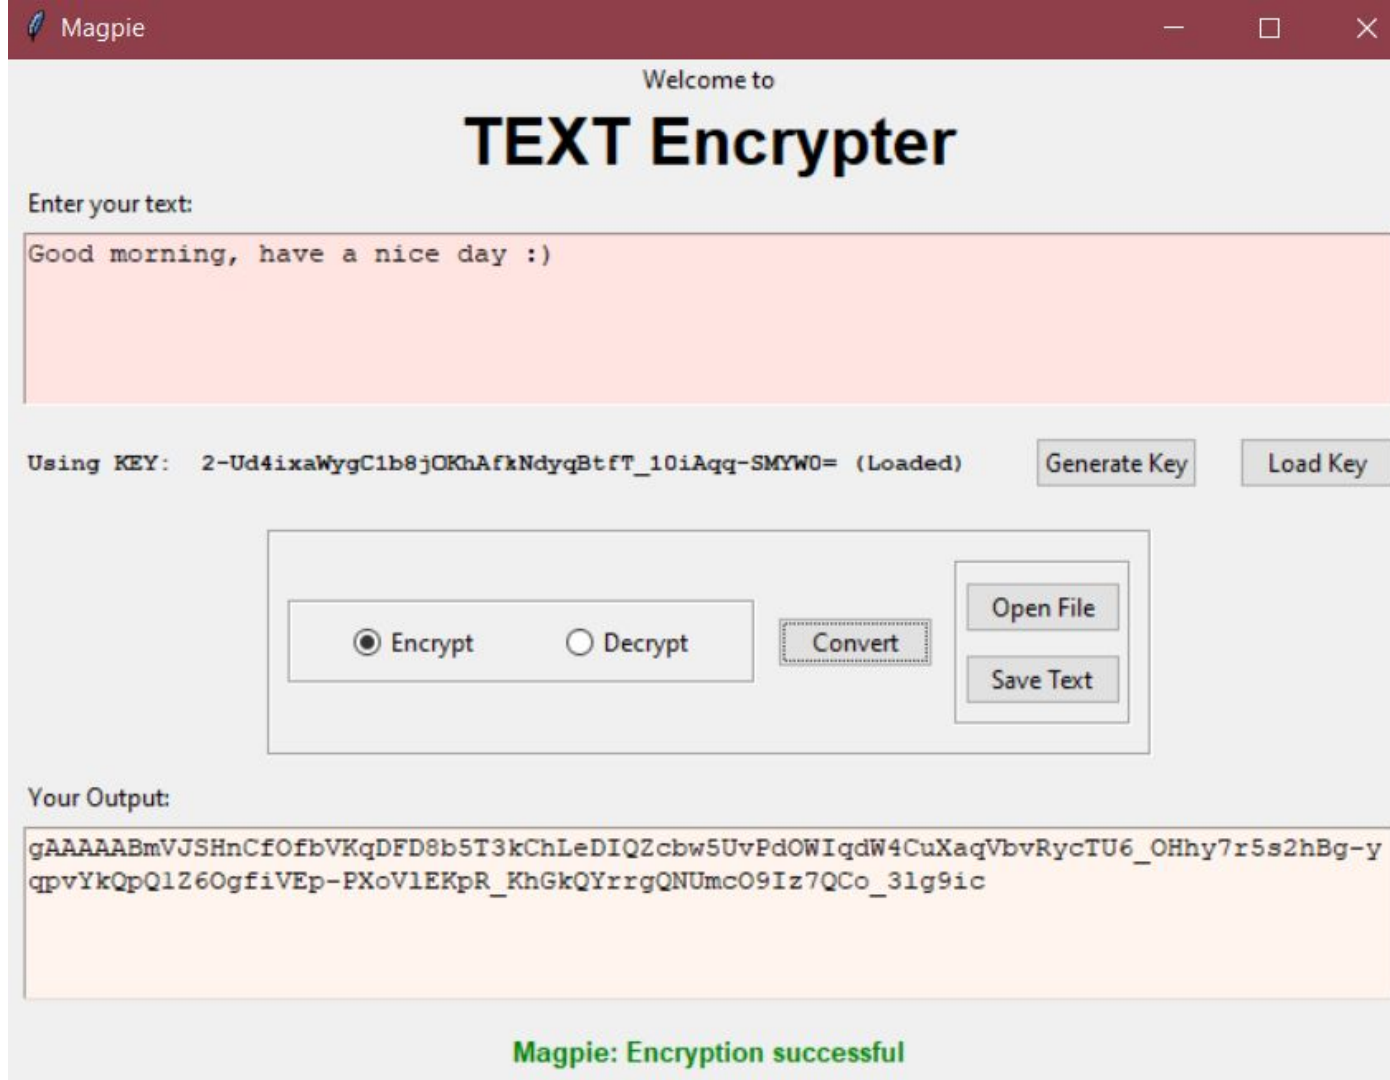

Correct when entered text matches with input

```
Enter option: d
Enter Ciphered Text: gAAAAABzs
Want to enter key? (y/n): n
Ciphered Text did not match
```

Error when entered text doesn't match with input

Output

Encryption using
GUI (Graphical
User Interface)

Output

Decryption using
GUI (Graphical
User Interface)

Welcome to

TEXT Encrypter

Enter your text:

gAAAAABmVJSHnCfOfbVKqDFD8b5T3kChLeDIQZcbw5UvPdOWIqdW4CuXaqVbvRycTU6_OHhy7r5s2hBg-y
qpYkQpQlZ6OgfiVEp-PXoVlEKpR_KhGkQYrrgQNUmc09Iz7QCo_3lg9ic

Enter your KEY:

Clear Key

Load Key

☐ Encrypt ☒ Decrypt

Convert

Open File

Save Text

Your Output:

Good morning, have a nice day :)

Magpie: Decryption successful

Conclusion

The Secure Message Encryption and Decryption System represents a fundamental building block for implementing secure communication and data protection in Python-based applications.

By prioritizing key management, robust encryption algorithms, and error handling mechanisms, the system offers a reliable solution for safeguarding sensitive information against unauthorized access and tampering.
